

Setting up an ODBC data source under Windows 2000

1. Start the ODBC Data Source Administrator application by running `odbcad32` (use Run under Start menu). It should look like

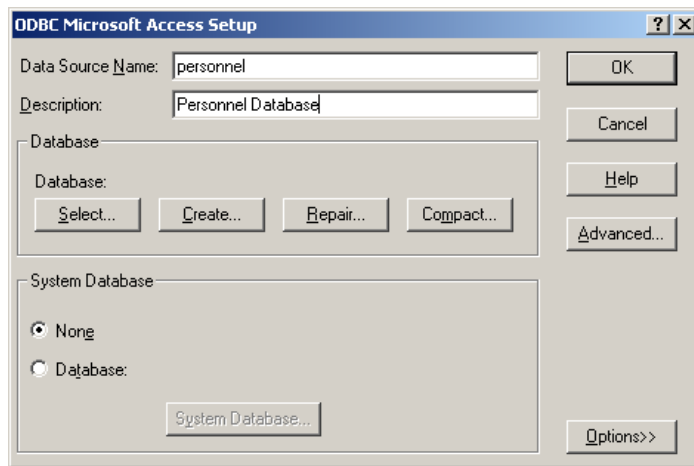

This lists the data sources already available.

2. Make sure that the User DSN tab is selected and click Add.... The Create New Data Source dialog should pop up.

3. Select Microsoft Access Driver and click Finish. The ODBC Microsoft Access Setup dialog should pop up.

- a. Fill in the Data Source Name field with the name you want to use for your ODBC data source. You will use this name in applications that access the database via ODBC.
- b. Fill in the Description field with some textual description of the database being accessed.
- c. Click on Select... and select your database file. This should return you to the dialog box above.
- d. Finally, click OK. This should take you back to the ODBC Data Source Administrator, which you may close by clicking OK.
